

CARENOW

# Family care and local transport

Innovation exhibition presentation

Working prototype and pilot proposal  
Bangladesh · September 2026

AI-generated editorial illustration

# One application for a family service journey

## Family context

Select the person receiving care.

## A complete job

Request, assignment, acceptance and status.

## Five account types

Customer, care professional, driver, doctor and provider.

## Bangladesh context

**175.69m**

**People in 2025**

World Bank population estimate

**128.99m**

**Internet subscriptions**

BTRC, January 2026

**73%**

**Out-of-pocket share**

Health expenditure, 2021

Reach, affordability and willingness to pay need separate evidence.

# The coordination problem

## **A family organises the visit**

Recipient details, contact information and timing need to stay together.

## **A provider assigns the work**

Someone must confirm the person, vehicle and service scope.

## **The family needs a status**

Acceptance and arrival should be understandable without repeated follow-up.

# Doctor discovery and booking

Find a specialist

Review a demo profile

Choose recipient and time

# Home care requests

Explore services

Inspect service scope

Arrange a visit

# Care status and arrival visibility

Ordered job status

Simulated care team location

# Transport with street maps and road routes

## Four vehicle classes

Ambulance, accessible van, truck and minibus.

## Relevant booking details

Cargo, capacity, passenger count and scheduled departure.

## Responsive booking controls

Scrollable compact layout and an animated drawer on taller phones.

# Broader transport in the same product

## Assisted travel

Vehicle suitability and reliable pickup.

## Household cargo

Capacity, loading details and timing.

## Group journeys

Passenger count and whole-vehicle hire.

# Working demo and production requirements

| Area         | Working demonstration             | Before real operation                       |
|--------------|-----------------------------------|---------------------------------------------|
| Bookings     | Forms, state and history          | Supplier capacity and operating rules       |
| Maps         | Street tiles and route simulation | Consented GPS and dispatch                  |
| Consultation | Messages and simulated call       | Verified clinicians and real communications |
| Accounts     | Five roles in one demo session    | Identity, consent and permissions           |
| Payments     | Fictional fares and earnings      | Collection, settlement and refunds          |

# Competition and adjacent services

| Organisation     | Public offering               | Overlap              |
|------------------|-------------------------------|----------------------|
| DocTime          | Video consultation            | Doctor access        |
| Praava Ghore Lab | Home sample collection        | Diagnostics          |
| HelloTask        | Domestic worker service       | Household assistance |
| Truck Lagbe      | Truck hire and logistics      | General transport    |
| Shohoz           | Bus, train and flight tickets | Travel booking       |

CareNow tests continuity across a family's service journey.

# Bottom-up opportunity scenarios

**BDT million**  
**Annual service value**

2.4 bookings per year  
BDT 1,500 per booking  
12% platform fee

Independent illustrative scenarios  
No customer traction claimed

# Unit economics need repeat use

**BDT 100**

Contribution per completed booking

**BDT 600 acquisition cost requires  
6 completed bookings to repay.**

| Fee | Contribution | CAC payback |
|-----|--------------|-------------|
| 10% | BDT 70       | 9 orders    |
| 12% | BDT 100      | 6 orders    |
| 15% | BDT 145      | 5 orders    |

Variable costs and demand are unmeasured.

# Six-month pilot budget

23.69 lakh

BDT 2.369 million  
Including 15% contingency

Budget bars show  
BDT thousand

# Cloud infrastructure cost

| Monthly Worker load | CPU per request | Workers estimate |
|---------------------|-----------------|------------------|
| 1 million requests  | 5 ms            | USD 5.00         |
| 15 million requests | 7 ms            | USD 8.00         |
| 20 million requests | 10 ms           | USD 11.40        |

Early infrastructure can be inexpensive. Fulfilment, support and governance still need a real budget.

# Application architecture

Client rendering

Bounded exhibition data

# Data and state integrity

## Shared domain objects

Family members, appointments, care requests and transport jobs.

## Ordered job transitions

Assignments and acceptance precede travel and completion.

## Versioned persistence

Compare-and-swap updates prevent silent lost changes.

## Production migration

Separate identities, organisations, consent, event history and media.

# Privacy and access controls

| Implemented in the demo               | Required production work                     |
|---------------------------------------|----------------------------------------------|
| Isolated session and ownership checks | Individual identity and role permissions     |
| Validated actions and prepared SQL    | Access audit and incident response           |
| Attachment type and size checks       | Secure media storage and retention           |
| Separate offline rehearsal            | Consent, delegation and device-loss controls |

No clinical security certification is claimed.

# Clinical and operational governance

## Clinical accountability

Qualified lead, verified professionals and scoped services.

## Transport readiness

Vehicle capability, capacity, operator responsibility and escalation.

## Recipient and worker protection

Consent, safeguarding and an accessible complaint route.

## Emergency boundaries

The demo makes no real dispatch or clinical response promise.

# Proposed research and pilot methodology

## Discovery

24 household participants  
8 care professionals  
6 drivers  
4 provider operators

## Operational evaluation

Up to 100 households  
A defined Dhaka service area  
Six weeks after readiness gates  
Baseline coordination comparison

Observe task success, fulfilled jobs, support effort and total cost.

# Pilot decision criteria

| Measure                 | Proposed decision rule            |
|-------------------------|-----------------------------------|
| Core task success       | At least 85% without coaching     |
| Accepted job fulfilment | At least 90% within defined scope |
| Coordination burden     | Lower than documented baseline    |
| Support cost            | Fits measured contribution margin |
| Safety and privacy      | Investigate every material event  |

# Motion and performance evidence

## About 59 fps

Observed route cadence in one emulator sample

**This does not establish sustained 60 fps across the app.**

Reduced motion, background pause and responsive layout are implemented.

Next acceptance work

Controlled physical-device traces

Keyboard and sheet interaction

Startup, memory and battery

Full accessibility review

# Material risks and accountable owners

| Risk             | Required response                      | Owner      |
|------------------|----------------------------------------|------------|
| Unfilled service | Limit scope and confirm capacity       | Operations |
| Unqualified task | Credentials and defined scope          | Clinical   |
| Data exposure    | Consent, permissions and audit         | Security   |
| Poor economics   | Cohorts and contribution after support | Commercial |
| Research bias    | Protocol and negative findings         | Research   |

# Roadmap with evidence gates

| Stage                 | Evidence needed to proceed                       |
|-----------------------|--------------------------------------------------|
| Exhibition release    | Working build and repeatable scenarios           |
| Pilot preparation     | Partners, protocol and named owners              |
| Production foundation | Identity, consent and access acceptance          |
| Formative evaluation  | Observed usability and resolved critical defects |
| Operational pilot     | Fulfilment, safety and economic evidence         |
| Selective expansion   | A case for each new service or area              |

# The collaboration request

## A bounded Dhaka pilot

### **Service partners**

Accountable care and transport supply in a defined area.

### **Research partners**

Independent evaluation of usability, fulfilment and cost.

### **Milestone-based support**

A six-month planning envelope of BDT 2.369 million.

# A repeatable exhibition demonstration

Load and replay scenarios

Inspect the same job

Follow status changes

# Feature inventory

| Family and care                    | Transport and operations              |
|------------------------------------|---------------------------------------|
| Profiles, records and routine logs | Ambulance, van, truck and minibus     |
| Doctor search and dated bookings   | Capacity, cargo and departures        |
| Messages and PDF/photo uploads     | Map routes and simulated arrivals     |
| Motherhood and child support       | Five role workspaces                  |
| Notifications and activity history | Scenario replay and offline rehearsal |

# Responsive layout correction

## Flexible content

Tiles and labels grow with text.

## Bounded sheets

Long content stays scrollable.

## Measured map panel

The footer participates in layout.

# Market and research sources

## National context

World Bank, BTRC, UNFPA and Bangladesh National Health Accounts reporting.

## Primary research

Khatun et al, JMIR Human Factors 2024, e46566.

## Competitor evidence

Official DocTime, Praava, HelloTask, Truck Lagbe and Shohoz pages.

# Technical and policy sources

## Infrastructure pricing

Cloudflare Workers and D1 official pricing.

## Clinical governance context

DGHS publication listing and National Telehealth Guideline.

## Project evidence

Public source, release APK, QA, performance logs and screenshot gallery.
